

Placement Data Analysis Using Mean, Median, and Mode

descriptive							
	sl_no	ssc_p	hsc_p	degree_p	etest_p	mba_p	salary
Mean	108	67.3034	66.3332	66.3702	72.1006	62.2782	288655
Median	108	67	65	66	71	62	265000
Mode	1	62	63	65	60	56.7	300000

I analyzed a placement dataset that includes students' academic scores from 10th standard, 12th standard, degree, MBA, entrance test scores, and salary details. Based on the univariate analysis, the overall performance of the students in the dataset is at an average level.

The mean values show that students scored an average of 67.3 marks in 10th standard, 66.3 marks in 12th standard, and 66.3 marks in degree studies. Similarly, students obtained average scores in the entrance test and MBA as well. From this analysis, it is understood that most students in the dataset have average academic performance. The salary distribution also indicates that students are generally receiving average-level salary packages.

The median salary value differs from the mean salary by nearly 2 lakhs because the median reduces the effect of outliers. Therefore, the Median gives a more accurate representation of the typical salary level of students in the dataset.

The mode analysis shows the most frequently occurring marks among students. Most students scored 62 marks in 10th standard, 63 marks in 12th standard, and 65 marks in degree studies. In the entrance test, the most common score was 60 marks, while the MBA mode score was 56.7, which indicates that many students obtained comparatively lower MBA marks.

In conclusion, the univariate analysis of this placement dataset shows that most students demonstrate average academic performance and receive average salary packages. Additionally, many students in the dataset received salary packages around 3 lakhs per annum.
